

Capitol Coating Concepts was formed in October of 2012, and is located in Sterling, Virginia. Similar to the founder of electrostatic coating, Harold P. Ransburg, the company founder, David Lynch, grew up working at his father's business in Grand Rapids, MI – BOSS Electrostatic Inc. After more than 13 years of mentorship and learning to perfect the skilled technique of re-purposing existing metal materials, Lynch was ready to bring the specialized service to a broader community. The metropolitan DC area was picked as the perfect location for this new venture, given its robust economy and diverse business environment.

Capitol Coating Concepts specializes in the application of electrostatic applied coatings. The specialized process can be applied to any metal surface, be it steel, aluminum, cast iron, or brass. The technique is suitable for any environment, from interior to exterior, to extremely corrosive settings where paint failure is not an option.

Capitol Coating Concepts is able to provide service onsite, or can transport items for refinishing in-house at the company facility. Only the best products and equipment are used to ensure the end product is second to none. Lynch is constantly pushing his team and suppliers to think outside the box. The company's skilled technicians can identify design elements that can be re-purposed while maintaining a clients' design intent. Available in an infinite number of colors and textures, the coating options are virtually endless and will stretch the limits of even the most imaginative designer.

By pushing beyond the boundaries of its competitors, Capitol Coating Concepts gives more value and a better product to customers, no matter what the project may be. Capitol Coating Concepts pledges to never stop driving the potential of the trade and hopefully "change the way you look at paint".
